The Monotropa is a Feedback EQ distortion module.
Use this effect as a sound destructor, weird oscillator, CV mutator.
Route effects through the EXT path for more audio mangling
Add CV 'sidechain' control over the feedback path.

Features: 4 band feedback EQ distortion.

2x audio / CV inputs

2x audio / CV outputs

1x EXT audio input

1x EXT audio output

4 potmeters for Frequency gain

1 potmeter for Feedback amount

1 potmeter for total Volume amount

Quickstart: (use the base settings)

Patch a simple percussion sound, like a basedrum, to input 1.

Patch output 1 to a mixer.

Turn the Band 1 potmeter slowly to CW.

Listen to the changes in the sound.

Now play with all Band potmeters. There are a lot of sweetspots!

Adjust the Feedback potmeter. Notice how the feedback has a tipping point. Adjust the Volume potmeter. Notice how this also affects the Feedback settings.
